

# Computer Organization: A Programmer's Perspective

---

## Machine-Level Programming (3: Procedures)

Gal A. Kaminka  
[galk@cs.biu.ac.il](mailto:galk@cs.biu.ac.il)

# Mechanisms in Procedures

## ■ Passing control

- To beginning of procedure code
- Back to return point

## ■ Passing data

- Procedure arguments
- Return value

## ■ Memory management

- Allocate during procedure execution
- Deallocate upon return

## ■ Mechanisms all implemented with machine instructions

```
P (...) {  
    .  
    .  
    y = Q(x);  
    print(y)  
    .  
}
```

```
int Q(int i)  
{  
    int t = 3*i;  
    int v[10];  
    .  
    return v[t];  
}
```

# x86-64 Linux Memory Layout

## ■ Stack

- Runtime stack (default 8MB limit)
- E. g., local variables

## ■ Heap

- Dynamically allocated as needed
- When call `malloc()`, `calloc()`, `new()`

## ■ Data

- Statically allocated data
- E.g., global vars, `static` vars, string constants

## ■ Text / Shared Libraries

- Executable machine instructions
- Read-only

00007FFFFFFF

*not drawn to scale*

# Stack

- Region of memory
- Managed with stack discipline
- Grows toward lower addresses
- Register `%rsp` indicates lowest stack address
  - address of top element

# Stack Pushing

- `pushq Src`
- Fetch operand at `Src`
- Decrement `%rsp` by 8
- Write operand at address given by `%rsp`

# Stack Popping

- `popq Dest`
- Read operand at address given by `%rsp`
- Increment `%rsp` by 8
- Write to *Dest* (register!)

# Stack Operation Examples

## (32 bits: pushl, popl)

pushl %eax

popl %edx

# Stack use in procedure calls: Passing Control

# Procedure Control Flow

- **Use stack to support procedure call and return**
- **Procedure call:** `call label`
  - Push return address on stack
  - Jump to label
- **Return address:**
  - Address of the next instruction right after call
  - Example from disassembly
- **Procedure return:** `ret`
  - Pop address from stack
  - Jump to address

# Code Example

```
void multstore
(long x, long y, long *dest) {
    long t = mult2(x, y);
    *dest = t;
}
```

```
00000000000400540 <multstore>:
400540: push    %rbx           # Save %rbx
400541: mov     %rdx,%rbx      # Save dest
400544: callq   400550 <mult2> # mult2(x,y)
400549: mov     %rax, (%rbx)    # Save at dest
40054c: pop     %rbx           # Restore %rbx
40054d: retq                      # Return
```

```
long mult2
(long a, long b)
{
    long s = a * b;
    return s;
}
```

```
00000000000400550 <mult2>:
400550: mov     %rdi,%rax      # a
400553: imul    %rsi,%rax      # a * b
400557: retq                      # Return
```

# Control Flow Example #1

```
00000000000400540 <multstore>:  
.  
.  
400544: callq 400550 <mult2>

# Call Chain Example

## Code Structure

```
yoo (...)  
{  
  .  
  .  
  who ();  
  .  
  .  
}
```

```
who (...)  
{  
  . . .  
  amI ();  
  . . .  
  amI ();  
  . . .  
}
```

```
amI (...)  
{  
  .  
  .  
  amI ();  
  .  
  .  
}
```

Procedure `amI` recursive

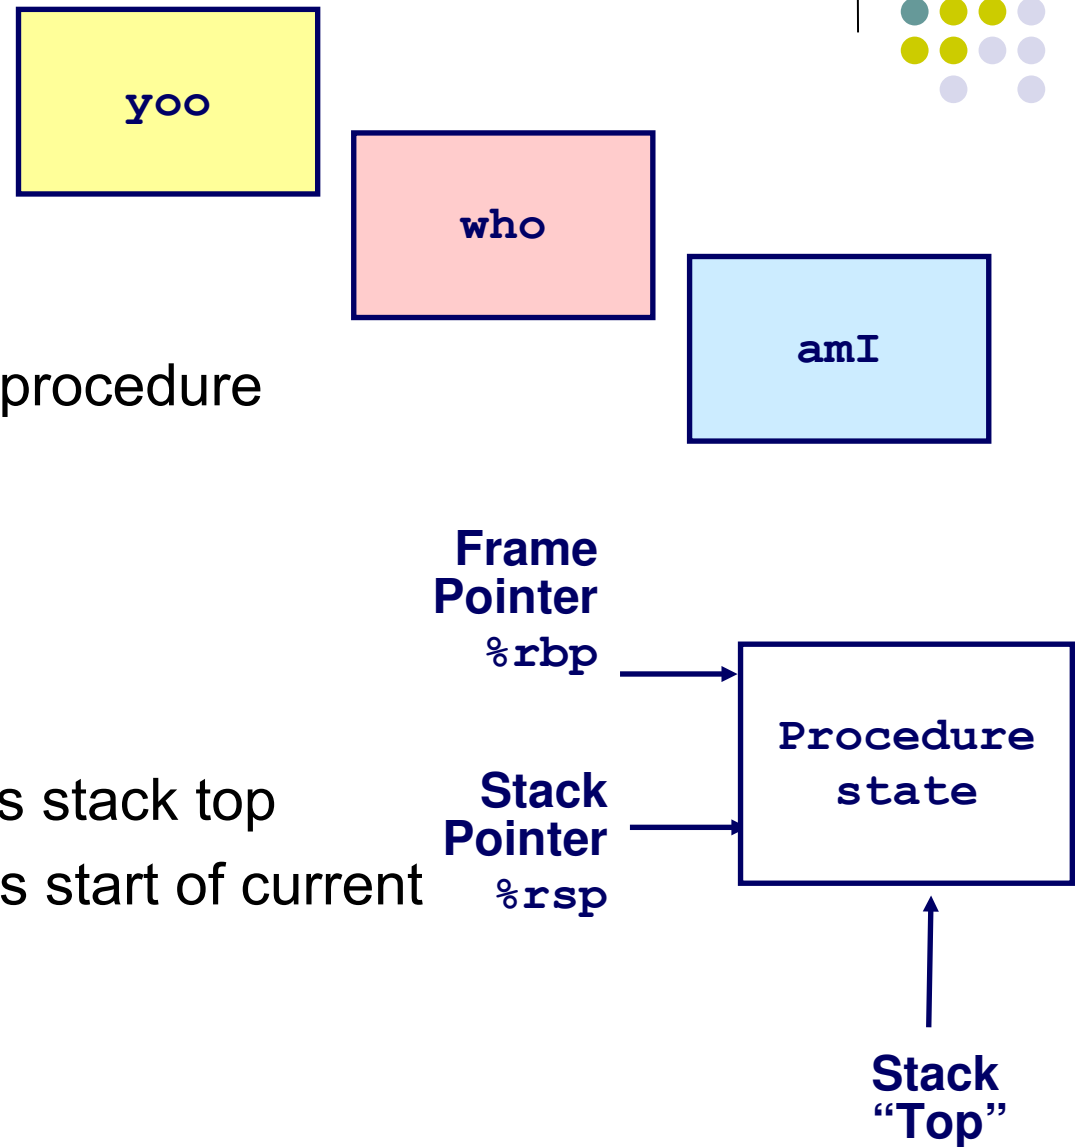

## Call Chain

# Stack Frames

- Contents
  - Local variables
  - Return information
  - Temporary space
- Management
  - Space allocated when enter procedure
    - “Set-up” code
  - Deallocated when return
    - “Finish” code
- Pointers
  - Stack pointer `%rsp` indicates stack top
  - Frame pointer `%rbp` indicates start of current frame

# Recursion uses the stack!

- Code must be “*Reentrant*”
  - Multiple simultaneous instantiations of single procedure
  - Use stack to store state of each instantiation:
    - Arguments
    - Local variables, saved registers
    - Return pointers
- Stack Discipline
  - State for given procedure needed for limited time
    - From when called to when return
  - Callee returns before caller does
- Stack Allocated in *Frames*
  - state for single procedure instantiation

# Linux Stack Frame

- Current Stack Frame (“Top” to Bottom)

- Parameters for function about to call
  - “Argument build”
- Local variables
  - If can’t keep in registers
- Saved register context
- Old frame pointer

- Caller Stack Frame

- Return address
  - Pushed by `call` instruction
- Arguments for this call

# Calling Conventions in IA32

# Revisiting swap

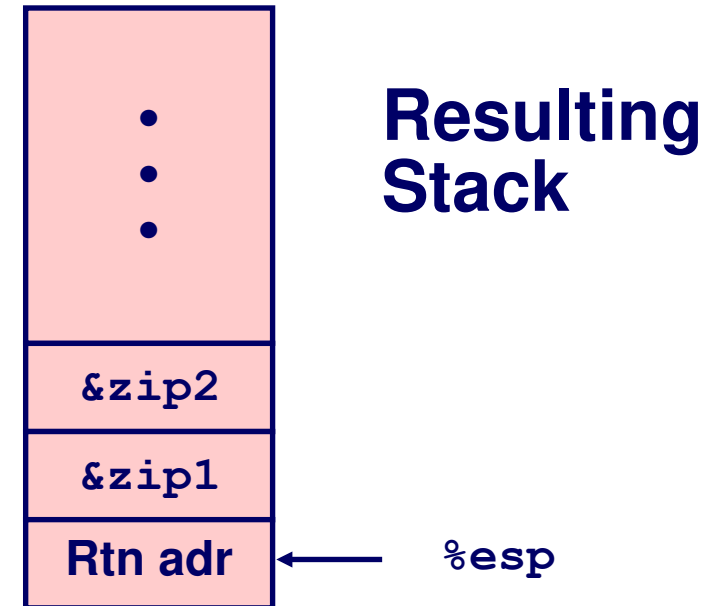

```
int zip1 = 15213;
int zip2 = 91125;

void call_swap()
{
    swap(&zip1, &zip2);
}
```

```
void swap(int *xp, int *yp)
{
    int t0 = *xp;
    int t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

## Calling swap from call\_swap

```
call_swap:
    . . .
    pushl $zip2    # Global Var
    pushl $zip1    # Global Var
    call swap
    . . .
```

# Revisiting swap

```
void swap(int *xp, int *yp)
{
    int t0 = *xp;
    int t1 = *yp;
    *xp = t1;
    *yp = t0;
}
```

swap:

```
    pushl %ebp
    movl %esp,%ebp
    pushl %ebx
```

Set  
Up

```
    movl 12(%ebp),%ecx
    movl 8(%ebp),%edx
    movl (%ecx),%eax
    movl (%edx),%ebx
    movl %eax,(%edx)
    movl %ebx,(%ecx)
```

Body

```
    movl -4(%ebp),%ebx
    movl %ebp,%esp
    popl %ebp
    ret
```

Finish

# swap Setup #1

## Entering Stack

## Resulting Stack

```
swap:  
    pushl %ebp  
    movl %esp,%ebp  
    pushl %ebx
```

# swap Setup #2

## Entering Stack

```
swap:  
    pushl %ebp  
    movl %esp,%ebp  
    pushl %ebx
```

## Resulting Stack

# swap Setup #3

## Entering Stack

swap's  
Stack

Exiting  
Stack

## Observation

Saved & restored register `%ebx`

Didn't do so for `%eax`, `%ecx`, or `%edx`

```
movl -4(%ebp), %ebx
movl %ebp, %esp
popl %ebp
ret
```

# Register Saving Conventions

When procedure `yoo` calls `who`:

`yoo` is the *caller*, `who` is the *callee*

## Can Register be Used for Temporary Storage?

```
yoo:
    . . .
    movl $15213, %edx
    call who
    addl %edx, %eax
    . . .
    ret
```

```
who:
    . . .
    movl 8(%ebp), %edx
    addl $91125, %edx
    . . .
    ret
```

Contents of register `%edx` overwritten by `who`

# Register Saving Conventions

- When procedure `yoo` calls `who`:
  - `yoo` is the *caller*, `who` is the *callee*
- Can Register be Used for Temporary Storage?
- Conventions
  - “Caller Save”
    - Caller saves temporary in its frame before calling
  - “Callee Save”
    - Callee saves temporary in its frame before using

# IA32/Linux Integer Register Usage

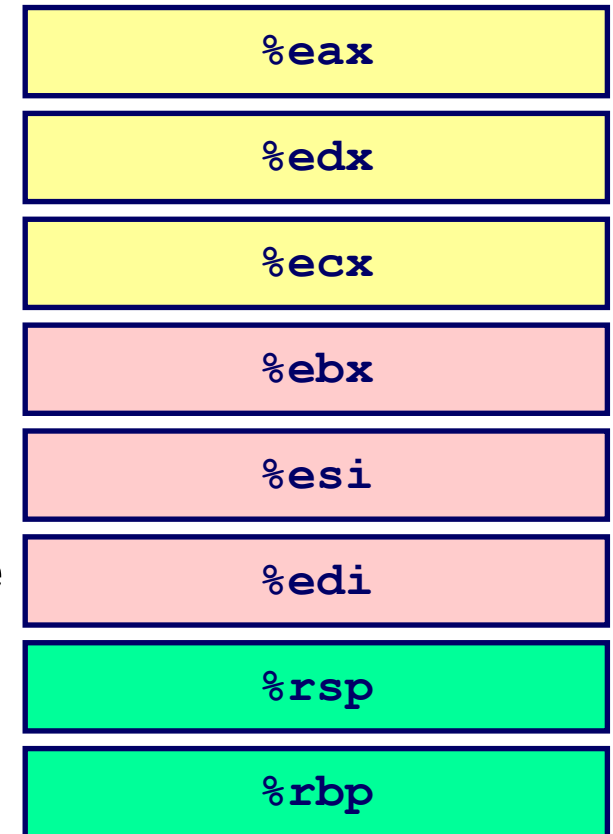

- Two have special uses: `%rbp`, `%rsp`
- Three managed as **callee-save**
  - `%ebx`, `%esi`, `%edi`
  - Old values saved on stack before using
- Three managed as **caller-save**
  - `%eax`, `%edx`, `%ecx`
  - Do what you please, but expect any callee to do so, as well

**Caller-Save  
Temporaries**

**Callee-Save  
Temporaries**

**Special**

# Calling conventions in AMD64

# x86-64 Linux Register Usage

## #1

### ■ **%rax**

- Return value
- Also caller-saved
- Can be modified by procedure

### ■ **%rdi, ..., %r9**

- Arguments
- Also caller-saved
- Can be modified by procedure

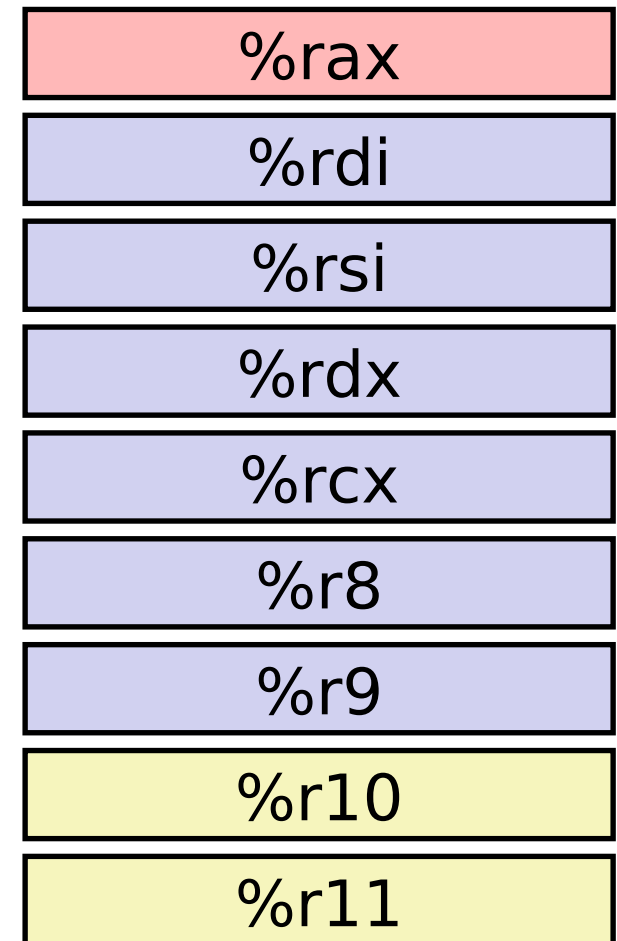

### ■ **%r10, %r11**

- Caller-saved
- Can be modified by procedure

Return value

Arguments

Caller-saved  
temporaries

# Example: incr (no recursion yet)

```
long incr(long *p, long val) {  
    long x = *p;  
    long y = x + val;  
    *p = y;  
    return x;  
}
```

```
incr:  
    movq    (%rdi), %rax  
    addq    %rax, %rsi  
    movq    %rsi, (%rdi)  
    ret
```

Register	Use(s)
%rdi	Argument <b>p</b>
%rsi	Argument <b>val</b> , <b>y</b>
%rax	<b>x</b> , Return value

# x86-64 Linux Register Usage

## #2

### ■ **%rbx, %r12, %r13, %r14**

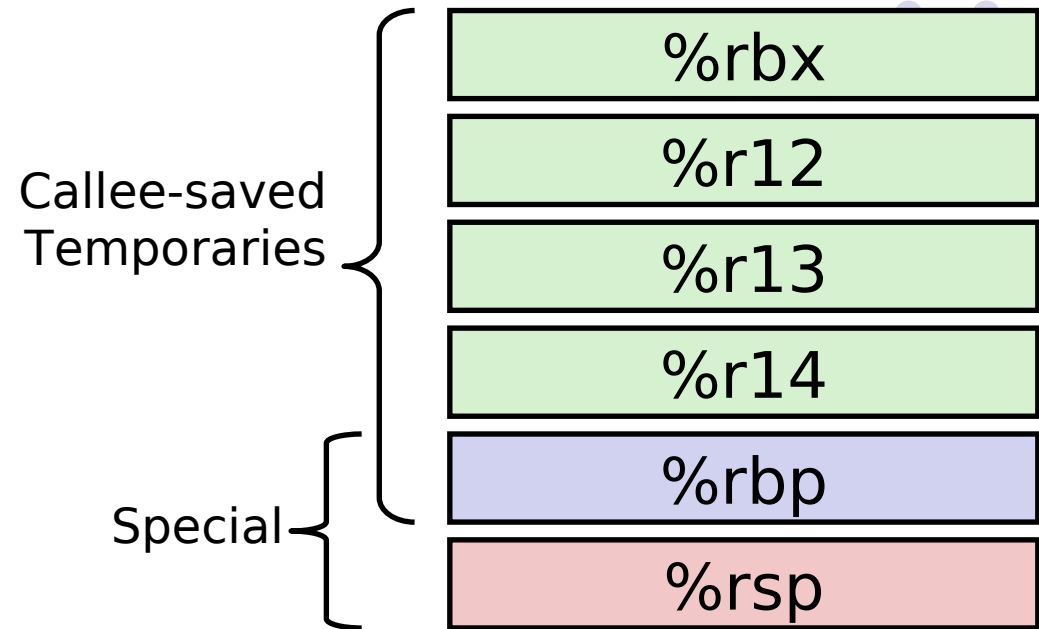

- Callee-saved
- Callee must save & restore

### ■ **%rbp**

- Callee-saved
- Callee must save & restore
- May be used as frame pointer
- Can mix & match

### ■ **%rsp**

- Special form of callee save
- Restored to original value upon exit from procedure

# Callee-Saved Example #1

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    subq     $16, %rsp  
    movq     %rdi, %rbx  
    movq     $15213, 8(%rsp)  
    movl     $3000, %esi  
    leaq     8(%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $16, %rsp  
    popq     %rbx  
    ret
```

Initial Stack Structure

Resulting Stack Structure

# Callee-Saved Example #2

Resulting Stack Structure

```
long call_incr2(long x) {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return x+v2;  
}
```

```
call_incr2:  
    pushq    %rbx  
    subq     $16, %rsp  
    movq     %rdi, %rbx  
    movq     $15213, 8(%rsp)  
    movl     $3000, %esi  
    leaq     8(%rsp), %rdi  
    call     incr  
    addq     %rbx, %rax  
    addq     $16, %rsp  
    popq     %rbx  
    ret
```

Pre-return Stack Structure

# Example: Calling incr #1

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

Initial Stack Structure

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Resulting Stack Structure

# Example: Calling incr #2

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

Register	Use(s)
%rdi	&v1
%rsi	3000

# Example: Calling incr #3

```
long call_incr() {  
    long v1 = 15213;  
    long v2 = incr(&v1, 3000);  
    return v1+v2;  
}
```

```
call_incr:  
    subq    $16, %rsp  
    movq    $15213, 8(%rsp)  
    movl    $3000, %esi  
    leaq    8(%rsp), %rdi  
    call    incr  
    addq    8(%rsp), %rax  
    addq    $16, %rsp  
    ret
```

Stack Structure

Register	Use(s)
%rdi	&v1
%rsi	3000

# Example: Calling incr #4

```
long call_incr() {  
    long v1 = 15213;

# Observations About Recursion

## ■ Handled Without Special Consideration

- Stack frames mean that each function call has private storage
  - Saved registers & local variables
  - Saved return pointer
- Register saving conventions prevent one function call from corrupting another's data
  - Unless the code explicitly does so (e.g., buffer overflow bug/attack)
- Stack discipline follows call / return pattern
  - If P calls Q, then Q returns before P
  - Last-In, First-Out

## ■ Also works for mutual recursion

- P calls Q; Q calls P

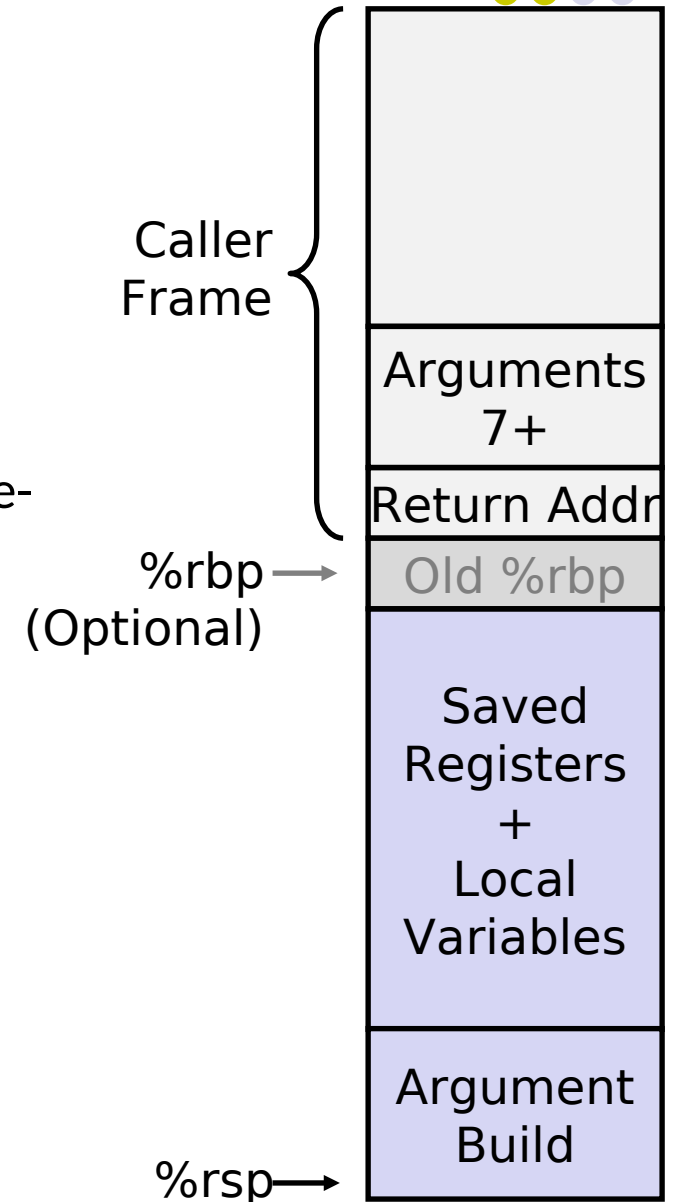

# x86-64 Procedure Summary

## ■ Stack is the right data structure

- If P calls Q, then Q returns before P

## ■ Recursion (& mutual recursion) handled by normal calling conventions

- Can safely store values in local stack frame and in callee-saved registers
- Put function arguments at top of stack
- Result return in %rax
- Pointers are addresses of values
  - On stack or global

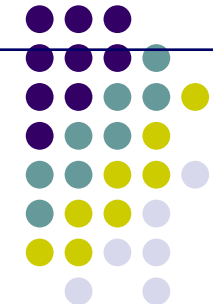

# Recursive Factorial

```
int rfact(int x)
{
    int rval;
    if (x <= 1)
        return 1;
    rval = rfact(x-1);
    return rval * x;
}
```

## Registers

%eax used without first saving

%ebx used, but save at beginning & restore at end

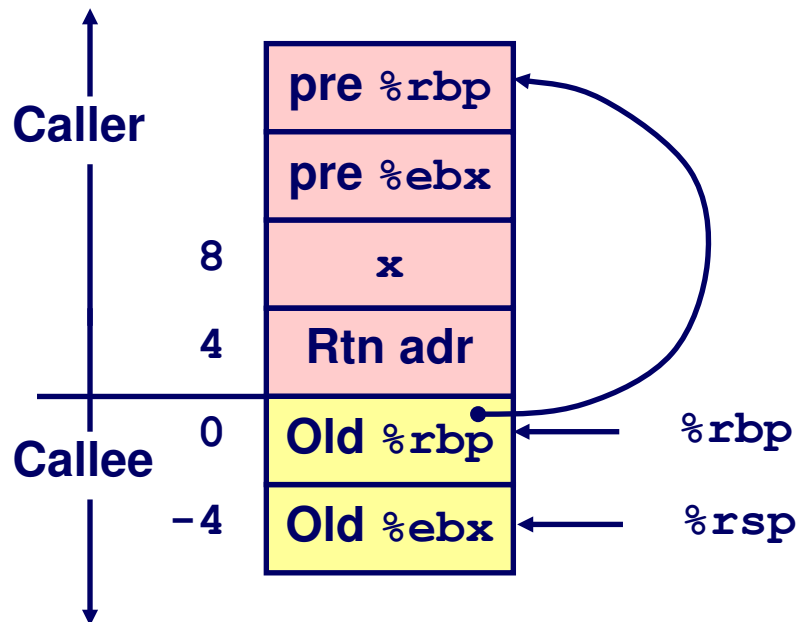

```
.globl rfact
.type
rfact,@function
rfact:
    pushl %rbp
    movl %rsp,%rbp
    pushl %ebx
    movl 8(%rbp),%ebx
    cmpl $1,%ebx
    jle .L78
    leal -1(%ebx),%eax
    pushl %eax
    call rfact
    imull %ebx,%eax
    jmp .L79
    .align 4

.L78:
    movl $1,%eax
.L79:
    movl -4(%rbp),%ebx
    movl %rbp,%rsp
    popl %rbp
    ret
```

# Rfact Stack Setup

```
rfact:
    pushl %rbp
    movl %rsp,%rbp
    pushl %ebx
```

# Rfact Body

Recursion

```
movl 8(%rbp),%ebx    # ebx = x
cmpl $1,%ebx         # Compare x : 1
jle .L78             # If <= goto Term
leal -1(%ebx),%eax   # eax = x-1
pushl %eax           # Push x-1
call rfact           # rfact(x-1)
imull %ebx,%eax       # rval * x
jmp .L79             # Goto done
.L78:                # Term:
    movl $1,%eax     # return val = 1
.L79:                # Done:
```

```
int rfact(int x)
{
    int rval;
    if (x <= 1)
        return 1;
    rval = rfact(x-1) ;
    return rval * x;
}
```

## Registers

%ebx Stored value of x

%eax

Temporary value of x-1

Returned value from rfact(x-1)

Returned value from this call

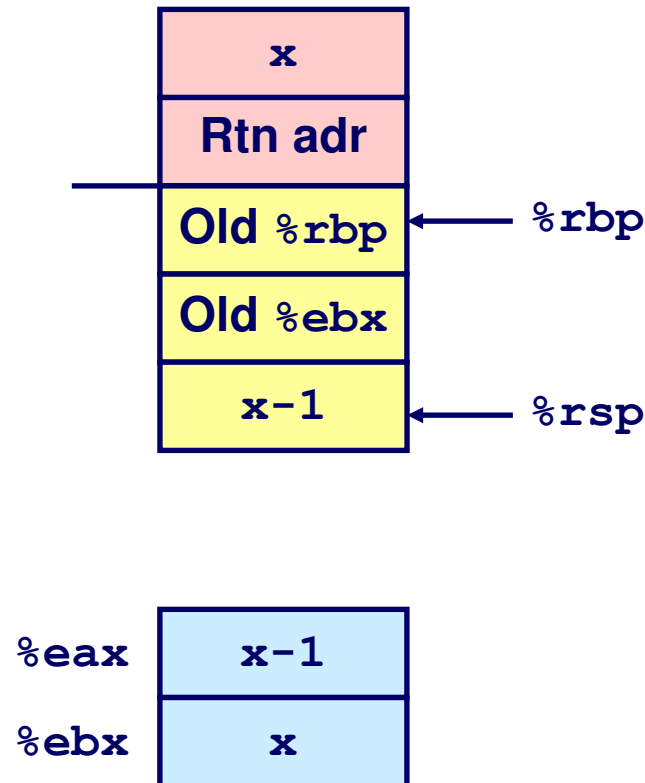

# Rfact Recursion

```
leal -1(%ebx), %eax
```

```
pushl %eax
```

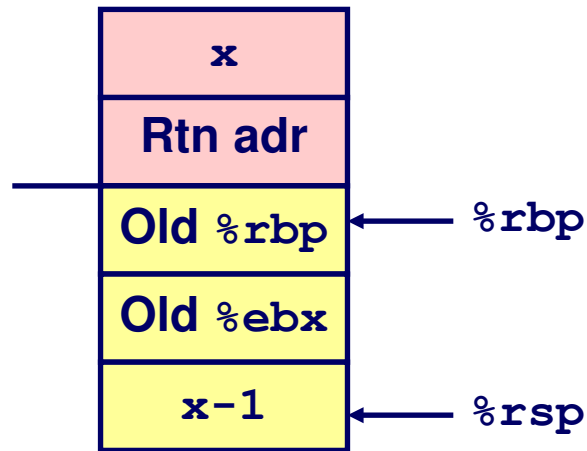

```
call rfact
```

# Rfact Result

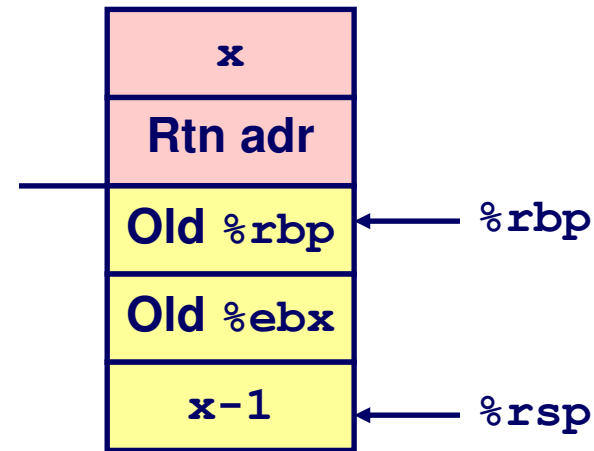

## Return from Call

Assume that `rfact(x-1)` returns **(x-1) !** in register `%eax`

```
imull %ebx,%eax
```

# Rfact Completion

```
movl -4(%rbp), %ebx
movl %rbp, %rsp
popl %rbp
ret
```

# Pointer Code

## Recursive Procedure

```
void s_helper
(int x, int *accum)
{
    if (x <= 1)
        return;
    else {
        int z = *accum * x;
        *accum = z;
        s_helper (x-1, accum);
    }
}
```

## Top-Level Call

```
int sfact(int x)
{
    int val = 1;
    s_helper(x, &val);
    return val;
}
```

Pass pointer to update location

# Creating & Initializing Pointer

## Initial part of sfact

```
_sfact:
    pushl %rbp          # Save %rbp
    movl %rsp,%rbp      # Set %rbp
    subl $16,%rsp       # Add 16 bytes
    movl 8(%rbp),%edx    # edx = x
    movl $1,-4(%rbp)    # val = 1
```

## Using Stack for Local Variable

Variable `val` must be stored on stack

Need to create pointer to it

Compute pointer as `-4 (%rbp)`

Push on stack as

second argument

```
int sfact(int x)
{
    int val = 1;
    s_helper(x, &val);
    return val;
}
```

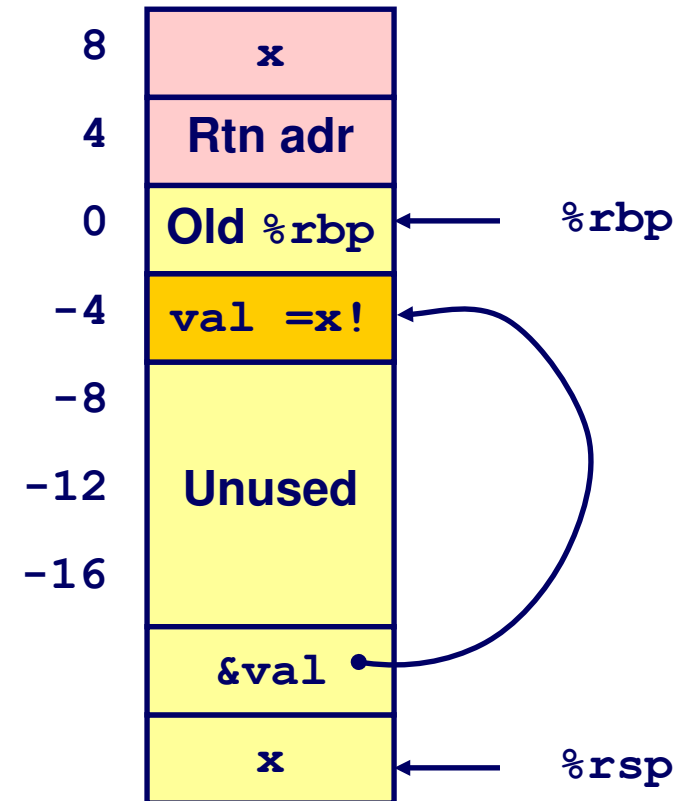

# Passing Pointer

## Calling `s_helper` from `sfact`

```
leal -4(%rbp),%eax # Compute &val
pushl %eax          # Push on stack
pushl %edx          # Push x
call s_helper       # call
movl -4(%rbp),%eax  # Return val
. . .              # Finish
```

```
int sfact(int x)
{
    int val = 1;
    s_helper(x, &val);
    return val;
}
```

Stack at time of call

# Using Pointer

```
void s_helper
(int x, int *accum)
{
    . . .
    int z = *accum * x;
    *accum = z;
    . . .
}
```

```
. . .
movl %ecx,%eax    # z = x
imull (%edx),%eax # z *= *accum
movl %eax, (%edx) # *accum = z
. . .
```

Register `%ecx` holds `x`

Register `%edx` holds pointer to `accum`

Use access `(%edx)` to reference memory
